### MODULETEK: SFP-SGMII-GE-100FX-D12

100M 1310nm Multi Mode SFP Optical Transceiver for SGMII port

### Overview

ModuleTek's SFP-SGMII-GE-100FX-D12 100Mb/s optical transceiver is used with Gigabit switches which support SGMII ports. The module has a PHY chip inside and can be used to support FE optical interfaces on gigabit switches. The product implements digital diagnostics via a 2-wire serial interface and is compliant with the SFP Multi-Source Agreement (MSA) standard.

### Product Features

- 100Mb/s transmission rate
- Compliant with IEEE 802.3, 100BASE-FX standard
- Compliant with SFP MSA
- For SGMII ports
- 1310nm FP laser
- Standard bail mechanism
- Built-in digital diagnostic functions
- Hot-Pluggable SFP footprint
- Duplex LC Connectors
- Low power consumption
- Up to 2km on MMF
- Power supply 3.3V
- RoHS Compliant
- Operating temperature range (Case Temperature):  
Commercial Level: 0°C to 70°C

### Applications

- 100BASE-FX

## Digital Diagnostic Functions

The SFP-SGMII-GE-100FX-D12 optical Transceiver has digital diagnostics. The product supports the 2-wire serial communication protocol defined in the SFP MSA and accesses digital diagnostic information via a 2-wire interface at address 0xA2. The digital diagnosis defaults to internal calibration. The micro control unit inside the module can access the module's operating parameters in real time, including operating temperature, bias current, output optical power, received optical power, and operating voltage. The module implements the alarm function of the SFP MSA.

**Functions Description**

The SFP-SGMII-GE-100FX-D12 is a 100M optical module that can be used in a Gigabit switch. The module integrates a PHY chip that supports the SGMII interface. The module is interconnected to the host’s Gigabit interface via the SGMII interface. Through the SGMII protocol, an optical interface conforming to the 100FX standard is provided. The product meets SFP specifications and

supports digital diagnostics to help Gigabit switch ports interconnect with 100M legacy optical interface devices.

The transmitter of the module consists of a laser driver and a TOSA (light-emitting component). The TOSA uses a FP laser with a wavelength of 1310 nm. When the module is working, the PHY chip output signal is sent to the laser driver section. At this time, the laser driver supplies the bias current and the modulation current to the laser. The laser driver simultaneously uses an automatic optical power control (APC) feedback loop to maintain a constant average optical power of the laser output.

The receiver of the module consists of a limiting amplifier and a ROSA (light receiving component). ROSA uses a PIN with a wavelength of 1310 nm. When ROSA detects the incident light signal, the PIN converts the optical signal into a photo-generated current. The photo-generated current is amplified by a TIA (transimpedance amplifier) and converted into an electrical signal. The electrical signal is further amplified by the limiting amplifier, then outputs a fixed-amplitude electrical signal to the host.

### Notes:

1. Circuit ground is isolated from chassis ground
2. Disabled: T<sub>DIS</sub>>2V or open, Enabled: T<sub>DIS</sub><0.8V
3. Should Be pulled up with 4.7k –10k ohm on host board to a voltage between 2V and 3.6V
4. LOS is open collector output
