### MODULETEK: XFP-10G-ER-x-C10

10GBASE 1550nm Single Mode XFP Optical Transceiver

#### XFP-10G-ER-x-C10 Overview

ModuleTek's XFP-10G-ER-x-C10 10Gb/s optical transceivers are designed for IEEE 802.3ae 10GBASE-ER, 10GBASEEW, 10GFC and OC192 interconnects. The product implements digital diagnostics functions via a 2-wire serial interface, compliant with XFP Multi-Source Agreement (MSA) Specification.

#### Product Features

- Up to 9.95 Gb/s to 11.3 Gb/s bit rates
- Compliant with IEEE 802.3ae, 10GFC, 10GBASE-ER/EW, OC192 application
- Compliant with XFP MSA
- Standard bail mechanism for consistent installation and removal
- Temperature-stabilized 1550nm EML laser
- Receiver with PIN
- Built-in digital diagnostic functions
- Hot Pluggable XFP footprint
- Duplex LC Connectors
- Up to 40km on SMF
- Low power consumption <2.5W
- RoHS Compliant
- Operating temperature range (Case Temperature) :  
Commercial Level : 0°C to 70°C  
Industrial Level : -40°C to 85°C

#### Applications

- 10GBASE-ER/EW 10G Ethernet
- 40km 10G Fiber Channel
- OC192 IR-2/STM S-64.2b

This module has the A0 write protection function. The user can enter the security level 1 working state and write the contents of Table 00 and Table 01 of the device address A0H of the module. The method to enter the working state of security level 1 is to write the security level 1 password in order in the 7BH-7EH registers of A0H of the module. After entering security level 1, the user can directly write to the contents of the A0H device address, or modify the contents of the A0H 7F table selection register to write to the contents of Table 00 or Table 01. This version of the module does not support users to modify the password of security level 1. If you need to modify the security level 1 password, you must notify our company to modify it before shipping.

## Digital Diagnostic Functions

ModuleTek’s XFP-10G-ER-x-C10 incorporates a XFP compliant 2-wire management interface which is used for serial ID, digital diagnostics and certain control functions. It is modeled on the SFF-8472 Rev 9.3 specification modified to accommodate a single 2-wire interface address. In addition to the basic I2C read/write functionality the modules support packet error checking that, when enabled, allows the host system to confirm the validity of any read data. Details of the protocol and interface are explicitly described in the MSA. The digital diagnostics provides real-time access to operating parameters via a 2-wire serial interface, including operating temperature, laser bias current, transmitted optical power, received optical power and operating voltage.

## Block-Diagram-of-Transceiver

## Functions Description

The transmitter consists of a laser driver chip and a TOSA (light-emitting component). The TOSA includes a laser, an electroabsorption modulator (EAM), a TEC, and a backlight diode. Unlike DML, EML TOSA uses external modulation. When the transmission rate of the system is high, the transmission distance is not only limited by the attenuation of the optical fiber, but also by the dispersion of the optical fiber, and the dispersion of the optical communication system is related to the modulation spectral width. The directly modulated laser has a large dispersion cost, and has spectral broadening, frequency chirp, and short transmission distance, so the external modulation method is adopted in the medium-long-distance transmission at a rate of 10 Gb/s. The TEC (Thermo Electric Cooler) Controls the temperature of the laser tube. When a temperature is set, the TOSA temperature of the module will remain unchanged through the control of the TEC. The wavelength of the module laser tube is related to the temperature of the laser tube. The module wavelength can be set by setting the TOSA temperature. When stable, the module has excellent wavelength stability. The electrical signal enters the optical module from the serial electrical interface and is then input to the laser driver chip. The laser driver chip supplies the bias current and the modulation current to the laser. The laser driver chip simultaneously uses an automatic optical power control (APC) feedback loop to maintain a constant average optical power of the laser output. The purpose is to eliminate the change of the output optical signal due to temperature changes and aging of the light source device. Clock Data Recovery Module (CDR) overcomes board and connector degradation by reshaping, regenerating, and reducing jitter. TX\_DIS is a input pin. When TX\_DIS is asserted High, the XFP module transmitter output must be turned off.

The receiver consists of a ROSA (light-receiving component) and a limiting amplifier chip, ROSA includes a PIN photodetector and a transimpedance amplifier chip. The ROSA detects the incident optical signal, converts the optical signal into an electrical signal, and outputs the electrical signal to the limiting amplifier. The limiting amplifier further amplifies the input signal and outputs a fixed amplitude electrical signal, and then shapes and synchronizes the electrical signal to the host through the CDR. Clock Data Recovery Module (CDR) overcomes board and connector degradation by reshaping, regenerating, and reducing jitter. The RX\_LOS of an output pin, when LOS is high, it indicates insufficient optical power for reliable signal reception. MOD\_NR is an output pin. When it is high, it indicates that the module detects the condition that invalidates the transmitter/receiver data. The transmission signal regulator loses lock, the transmitter laser fails, and the receiver signal regulator loses lock. The micro controller unit initializes the control register of laser driver, limiting amplifier and CDR. It monitors the running information from the laser driver, limiting amplifier and CDR, then reports this information to the customer.
